Notes:

1. The main script to run is **ANALYSIS_CODE.** This notebook utilizes **reddit_datset_final_politicaladded.parquet.** which includes political classifications generated using the alhalla/distilbart-mnli-12-3 model.

2. Since Large Language Models (LLMs) can exhibit stochastic variation this script is designed to load the pre-computed labels to ensure exact replication of the results presented in the paper.

3. If interested in the label classification, the source logic is available in the **Detailed_Code** folder. Re-running the classification will yield marginally different labels but will not significantly alter the direction or significance of the average treatment effect.
